MARKET REVIEW

Third Quarter 2017

Stock market returns

The 3rd quarter ended with a roar with global equities (stocks) posting quarterly returns of 4-8%. International & Emerging Market stocks outperformed US stocks by posting returns of 6-8% and US stocks had a healthy gain of 4%. For the year US stocks as measured by the Russell 3000, which captures large and small companies is up almost 14%. International and Emerging large stocks are up approximately 19% and 27%. In summary, it has been a very good 9 months for global stocks.

Interest rates and Inflation

Interest rates remained low along with inflation. Even with 2 rate hikes since the beginning of the year, the 10-year US bond has remained flat going from 2.45% at year-end to 2.33% as of 9/29/17. Short-term treasury bills have gone from .44% to .96% during the last 9 months. The consensus is on the side of at least one more rate hike of .25% before year-end. In summary, investors will need a number of ¼ percent rate hikes before we see interest rates prior to the 2008 economic collapse.

Economic Activity

The US economy was strong with a revised 2Q growth rate of 3.1% as measured by GDP. It is the strongest growth rate since the first three months of 2015. Increases in consumer spending and in nonresidential fixed investment were larger than previously estimated, offsetting a drag from government expenditure and investment. Housing prices locally and across most sections of the country are strong with hot spots on the West Coast.

Take Away

Past economic growth, interest rate changes and market returns are not leading indicators or valuable insight to the direction of future returns. Rather, it is strictly rear view mirror information. Unfortunately, there is no reliable SHORT-TERM indicator to predict market movements. This is why we continue to remind clients the investment decisions we make on your behalf are with a 7-10 year look forward. Over the last 90 years US stocks have averaged 10%, however, 30% of the time stocks are negative for a 12-month period. In summary, as unexciting as the reminder that patience and a long-term approach is fruitful, we need to be careful not to find ourselves looking at enticing yet unsuccessful short-term ideas. Timed tested strategy and process wins over ideas in investing.

IMPACT OF DIVERSIFICATION & 3Q RETURNS

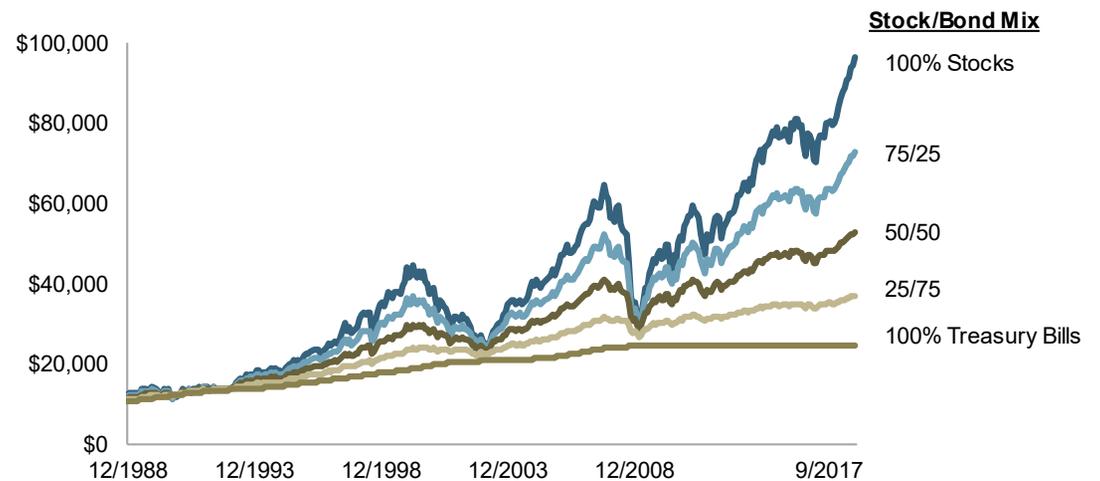

These portfolios illustrate the performance of different global stock/ bond mixes. Mixes with larger allocations to stocks are considered riskier but have higher expected returns over time. These higher returns do not materialize every day or every year. As illustrated in the Growth of Wealth chart, one can see portfolios that have more allocations to global stocks have had higher long-term returns.

I have bolded the returns for the YTD column to illustrate what investors should have approximated for the first nine months of this year. As discussed earlier, the first nine months of 2017 have been rewarding.

Ranked Returns (%)

Growth of Wealth: The Relationship between Risk and Return

Period Returns (%)

Asset Class	YTD	1 Year	3 Years*	5 Years*	10 Years*	* Annualized
						10-Year STDEV ¹

US STOCKS

Third Quarter 2017 Index Returns

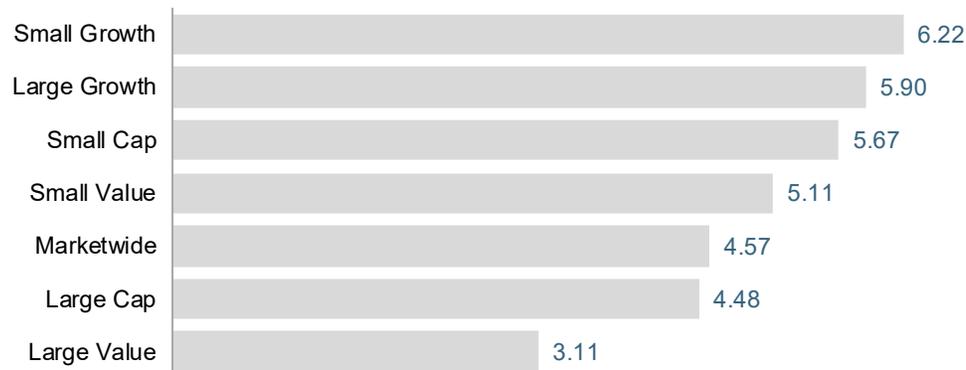

US stocks represent 52% of global stock valuations, while our share of GDP is less than 25%. Thus, our stock valuations are an over representation of Global economic activity. This illustrates the world has a high confidence level in our economy.

Stock market returns can be a mixed bag year to year. They can also be a mixed bag within a year. We divide stocks into groups to better understand returns. Large stocks vs. small stocks is one example. Under the YTD heading in the chart 'Period Returns', note Large Cap returns at 14.17% and Small Cap at 10.94%. Also note we can divide stocks into Value and Growth categories. So far this year, Growth is beating Value. Historically, small stocks and value stocks have provided 2-3% higher returns annually since 1928. For the first nine months of 2017 we can see the opposite is happening as large and growth are providing better returns. Thus, even though small and value have had higher historical returns, there is a randomness of returns year to year and one needs to be patient with a strategy and not be tempted to hop from one strategy to another.

INTERNATIONAL DEVELOPED STOCKS

Third Quarter 2017 Index Returns

In US dollar terms, International Developed markets outperformed US equity indices but underperformed emerging markets indices during the quarter.

There were some similarities and differences in International asset classes compared to US asset classes. For example, in the US, large stocks outperformed small YTD. The International market has seen the opposite: Small has outperformed Large. On the other side of the coin, the comparison of value and growth are similar. Growth stocks have generated better returns than Value in both markets.

EMERGING MARKETS STOCKS

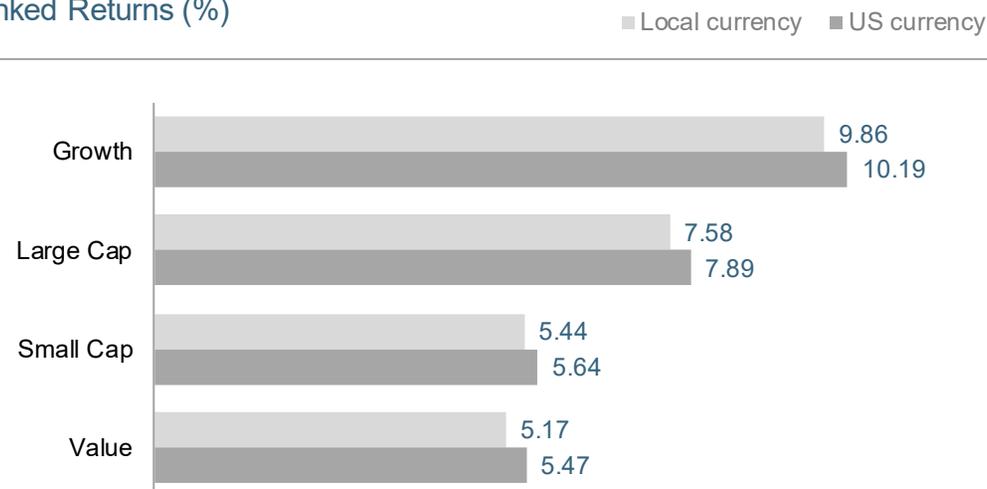

Third Quarter 2017 Index Returns

In US dollar terms, emerging markets indices outperformed developed market indices, including the US, during the quarter.

With broad market indices used as proxies, the value effect was negative meaning growth stocks had better returns. However, in the small cap space, the effect was the opposite as value outperformed growth.

Overall, small caps underperformed large caps in emerging markets.

FIXED INCOME

Third Quarter 2017 Index Returns

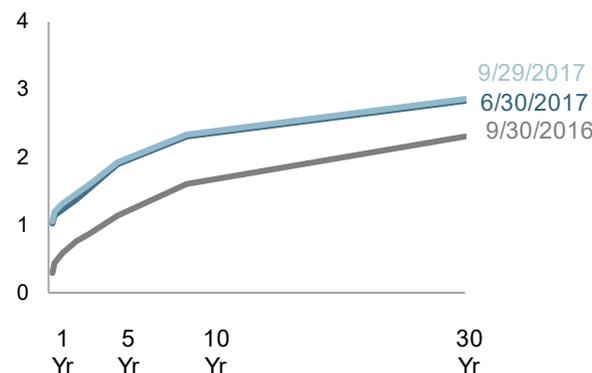

Interest rates increased across the US fixed income market for the quarter. The yield on the 5-year Treasury note increased by 3 basis points (bps) to 1.92%. The yield on the 10-year Treasury note increased by 2 bps to 2.33%. The 30-year Treasury bond yield increased by 2 bps to finish at 2.86%.

The yield on the 1-year T-bill rose 7 bps to 1.31%, and the 2-year Treasury note yield rose 9 bps to 1.47%. The yield on the 3-month Treasury bill increased 3 bps to 1.06%, while the 6-month Treasury bill yield increased 6 bps to 1.20%.

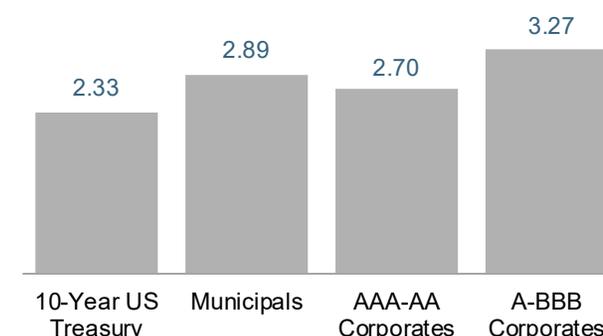

In terms of total returns, short-term corporate bonds gained 0.59%, and intermediate-term corporates gained 1.05%.

Short-term municipal bonds generated a total return of 0.49%, while intermediate-term municipal bonds returned 0.83%. General obligation bonds gained 1.14%, outperforming revenue bonds by 4 bps.

QUIT MONKEYING AROUND!

Third Quarter 2017

In the world of investment management there is an oft-discussed idea that blindfolded monkeys throwing darts at pages of stock listings can select portfolios that will do just as well, if not better, than both the market and the average portfolio constructed by professional money managers. If this is true, why might it be the case?

THE DART BOARD

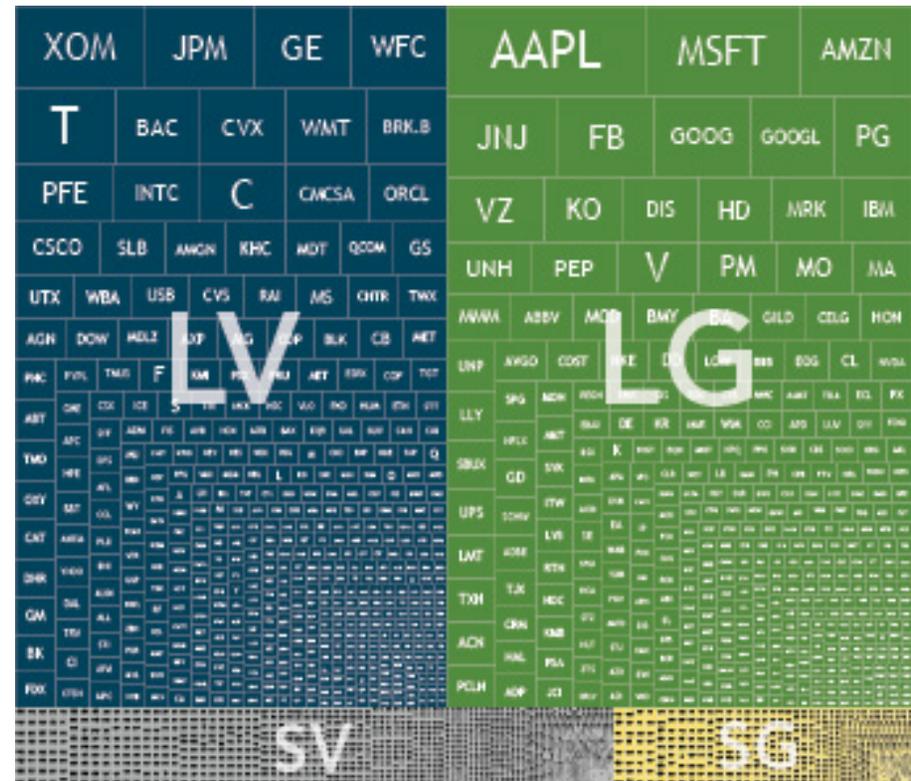

Exhibit 1 shows the components of the Russell 3000 Index (regarded as a good proxy for the US stock market) as of December 31, 2016. Each stock in the index is represented by a box, and the size of each box represents the stock's market capitalization (share price multiplied by shares outstanding) or "market cap" in the index. For example, Apple (AAPL) is the largest box since it has the largest market cap in the index. The boxes get smaller as you move from the top to the bottom of the exhibit, from larger stocks to smaller stocks. The boxes are also color coded based on their market cap and whether they are value or growth stocks. Value stocks have lower relative prices (as measured by, for instance the price-to-book ratio) and growth stocks tend to have higher relative prices. In the exhibit, blue represents large cap value stocks (LV), green is large cap growth stocks (LG), gray is small cap value stocks (SV), and yellow is small cap growth stocks (SG).

For the purposes of this analogy you can think of Exhibit 1 as a proxy for the overall stock market and therefore similar to a portfolio that, in aggregate, professional money managers hold in their competition with their simian challengers. Because for every investor holding an overweight to a stock

1. For more on this concept, please see "The Arithmetic of Active Management" by William Sharpe.

(relative to its market cap weighting) there must also be an investor underweight that same stock, this means that, in aggregate, the average dollar invested holds a portfolio that looks like the overall market.¹

Exhibit 1. US Stocks Sized by Market Capitalization

For illustrative purposes only. Illustration includes constituents of the Russell 3000 Index as of December 31, 2016, on a market-cap weighted basis segmented into Large Value, Large Growth, Small Value, and Small Growth. Source: Frank Russell Company is the source and owner of the trademarks, service marks, and copyrights related to the Russell Indexes. Please see Appendix for additional information.

QUIT MONKEYING AROUND!

(continued from page 10)

Exhibit 2, on the other hand, represents the dart board the monkeys are using to play their game. Here, the boxes represent the same stocks shown in Exhibit 1, but instead of weighting each company by market cap, the companies are weighted equally. For example, in this case, Apple's box is the same size as every other company in the index regardless of its market cap. If one were to pin up pages of newspaper stock listings to throw darts at, Exhibit 2 would be much more representative of what the target would look like.

When looking at Exhibits 1 and 2, the significant differences between the two are clear. In Exhibit 1, the surface area is dominated by large value and large growth (blue and green) stocks. In Exhibit 2, however, small cap value stocks dominate (gray). Why does this matter? Research has shown that, historically over time, small company stocks have had excess returns relative to large company stocks. Research has also shown that, historically over time, value (or low relative price) stocks have had excess returns relative to growth (or high relative price) stocks. Because Exhibit 2 has a greater proportion of its surface area dedicated to small cap value stocks, it is more likely that a portfolio of stocks selected at random by throwing darts would end up being tilted towards stocks which research has shown to have had higher returns when compared to the market.

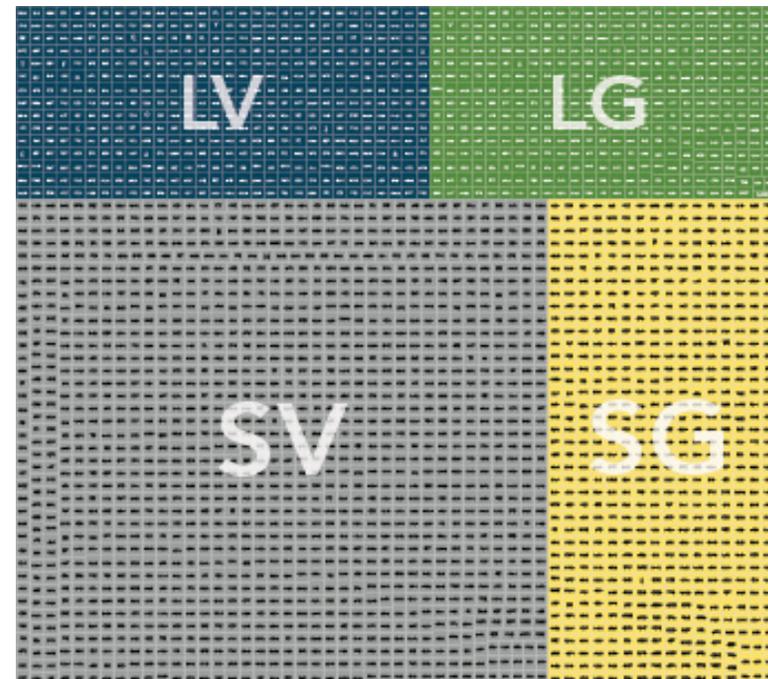

SO... THROW AWAY?

This does not mean, however, that haphazardly selecting stocks by the toss of a dart is an efficient or reliable way to invest. For one thing, it ignores the complexities that arise in competitive markets.

Consider as an example something seemingly as straightforward as a strategy that holds every stock in the Russell 3000 Index at an equal weight (the equivalent of buying the whole dart board in Exhibit 2). In order to maintain an equal weight in

all 3,000 securities, an investor would have to rebalance frequently, buying shares of companies that have gone down in price and selling shares that have gone up. This is because as prices change, so will each individual holding's respective weight in the portfolio. By not considering whether or not these frequent trades add value over and above the costs they generate, investors are opening themselves up to a potentially less than desirable outcome.

Exhibit 2. US Stocks Sized Equally

For illustrative purposes only. Illustration includes the constituents of the Russell 3000 Index as of December 31, 2016 on an equal-weighted basis segmented into Large Value, Large Growth, Small Value, and Small Growth. Source: Frank Russell Company is the source and owner of the trademarks, service marks, and copyrights related to the Russell Indexes. Please see Appendix for additional information.

QUIT MONKEYING AROUND!

(continued from page 11)

Instead, if there are well-known relationships that explain differences in expected returns across stocks, using a systematic and purposeful approach that takes into consideration real-world constraints is more likely to increase your chances for investment success. Considerations for such an approach include things like: understanding the drivers of returns and how to best design a portfolio to capture them, what a sufficient level of diversification is, how to appropriately rebalance, and last but not least, how to manage the costs associated with pursuing such a strategy.

THE LONG GAME

Finally, the importance of having an asset allocation well suited for your objectives and risk tolerance, as well as being able to remain focused on the long term, cannot be overemphasized. Even well-constructed portfolios pursuing higher expected returns will have periods of disappointing results. A financial advisor can help an investor decide on an appropriate asset allocation, stay the course during periods of disappointing results, and carefully weigh the considerations mentioned above to help investors decide if a given investment strategy is the right one for them.

CONCLUSION

So what insights can investors glean from this analysis? First, by tilting a portfolio towards sources of higher expected returns, investors can potentially outperform the market without needing to outguess market prices. Second, implementation and patience are paramount. If one is going to pursue higher expected returns, it is important to do so in a cost-effective manner and to stay focused on the long term.

APPENDIX

Large cap is defined as the top 90% of market cap (small cap is the bottom 10%), while value is defined as the 50% of market cap of the lowest relative price stocks (growth is the 50% of market cap of the highest relative price stocks). For educational and informational purposes only and does not constitute a recommendation of any security. The determinations of Large Value, Large Growth, Small Value, and Small Growth do not represent any determinations Dimensional Fund Advisors may make in assessing any of the securities shown.
